Efficient Library Management System (ELMS)

1. Introduction

The **Efficient Library Management System (ELMS)** is a C++ project designed to demonstrate the integration of **Object-Oriented Programming (OOP) principles** with multiple **data structures** such as **Stack, Queue, Linked List, Hash Table, and Binary Search Tree (BST)**.
It manages library operations like **borrowing, returning, employee search, and book search** efficiently.

This project also showcases concepts of **templates, file handling, and exception handling**, making it an ideal academic and practical implementation of advanced C++ programming.

---

2. Objectives

- Apply **OOP principles** (Abstraction, Encapsulation, Composition).
- Demonstrate the use of **multiple data structures** in a real-world problem.
- Enable efficient **book and employee management** using advanced C++ concepts.
- Showcase **file handling and exception handling** for robust software design.
- Provide a **structured, extensible, and maintainable project** suitable for academic or professional use.

---

3. Features

- OOP concepts: **Composition, Encapsulation, Abstraction**
- Book borrowing & returning handled with Queue
- Overdue and undo/redo functionality with Stack
- Fast book searching via Binary Search Tree (BST)
- Employee record management using Hash Table
- Data persistence via file handling (DataFile.txt)
- Exception handling for safe operations
- Use of templates for generic implementations
- User-friendly console interface with structured output

---

4. Technologies & Concepts Used

- **Language:** C++ (C++11/14 standard compatible)
- **OOP Concepts:** Abstraction, Encapsulation, Composition
- **Data Structures:**
  - Stack
  - Queue
  - Linked List
  - Hash Table
  - Binary Search Tree (BST)
- **Other Concepts:** Templates, File Handling, Exception Handling

---

5. Program Flow

1. Load book & employee data from DataFile.txt.
2. Display all loaded information.
3. Perform **book borrowing operations** (queue-based).
4. Perform **book returning operations** (queue + stack for undo).
5. Undo specific operations using **stack**.
6. Perform **book searching** using BST.
7. Perform **employee searching** using Hash Table.
8. Display program completion message.

---

6. How to Run

6.1 Clone the Repository

```
git clone https://github.com/Muneeb-techpro/efficient-library-management-system.git

cd efficient-library-management-system/src
```

6.2 Compile the Project

```
g++ *.cpp -o LibraryApp
```

6.3 Run the Executable

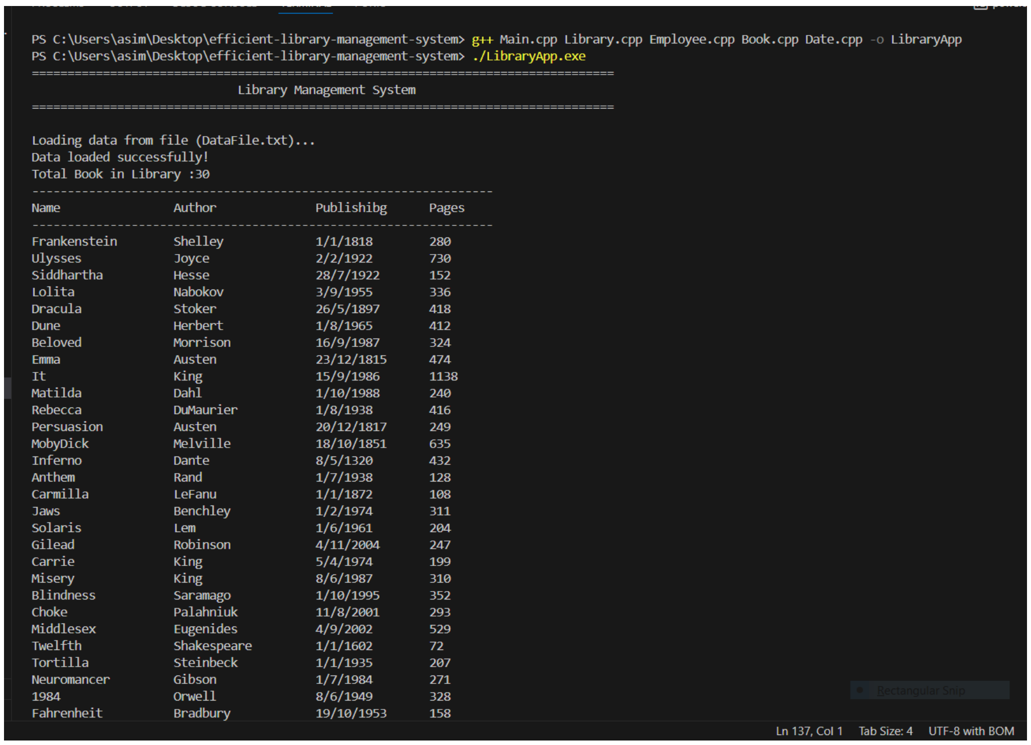
- **On Linux / macOS:**
  ```
  ./LibraryApp
  ```
- **On Windows (PowerShell or CMD):**
  ```
  LibraryApp.exe
  ```

---

7. Output (Screenshots + Logs)

📷 Screenshots

- 01_output.png – Program start screen



```
PS C:\Users\asim\Desktop\efficient-library-management-system> g++ Main.cpp Library.cpp Employee.cpp Book.cpp Date.cpp -o LibraryApp
PS C:\Users\asim\Desktop\efficient-library-management-system> ./LibraryApp.exe

9. Exception Handling

The project includes **robust exception handling** for cases such as:

- Missing DataFile.txt
- Invalid book or employee IDs
- Queue underflow/overflow in borrowing/returning operations
- Stack underflow in undo operations

---

10. Future Enhancements

These are some optional future enhancements that may be considered:

- Add a **GUI interface** (Qt/JavaFX/React frontend with backend integration).
- Add **database support** (MySQL/SQLite instead of text file).
- Implement **book recommendation system** using Graph.
- Add **user authentication** and member login system.
- Support for **digital e-books** and issue tracking.

---

11. Conclusion

The **Efficient Library Management System (ELMS)** successfully demonstrates how multiple data structures and OOP principles can be combined to build a robust and efficient C++ application.

It not only serves as a **functional library system** but also as a **learning project** for students to understand **data structures, OOP, templates, and exception handling** in real-world problem solving.
